The National Institutes of Health (NIH) seeks adults who have a movement disorder, such as essential tremor, dystonia, or Parkinson’s disease. The purpose of this study is to provide Deep Brain Stimulation (DBS) care to patients with movement disorders. Standard care will be provided as part of this protocol and you may be offered the option to participate in other related research studies.

**Study Includes:**
- 1-2 outpatient visits for medical and neurological evaluation including tests of movement, neuropsychological evaluation, and brain MRI
- 8 Outpatient visits after surgery. You will return to the NIH Outpatient clinic for every month for the first three months, then every 3 months during the first year, and every 6 months during the second year after surgery

**Who can participate in this research study?**
- Adults with PD, generalized dystonia, hemidystonia, cervical dystonia, or essential tremor (ET)
- Those who have tried medications for their movement disorder but still have severe symptoms
- Those who are able to provide their own informed consent in English or Spanish
- Those who have already had DBS for Parkinson, dystonia or ET and need further programming
- Those who do not have other medical issues such as, dementia, depression, or another psychiatric disorder

There is no cost for study-related tests and procedures. All study visits take place at the NIH Clinical Center, America’s Research Hospital, located on the Metro red line (Medical Center stop) in Bethesda, Maryland.
