

*A research study*  
*for*  
**Hereditary  
Stomach  
Cancer**

Researchers at the National Institutes of Health (NIH) seek individuals with hereditary stomach (gastric) cancer or who are at risk for developing stomach cancer because of a genetic (inherited) condition. Hereditary stomach cancers run in families, meaning they are passed from one generation to the next. In this study, we want to learn more about these types of stomach cancers as well as investigate the genes involved.

**Eligible participants are 2 or older and may have:**

- A family history of stomach cancer
- Hereditary diffuse gastric cancer (CDH1 mutation)
- A stomach lesion that is suspected to be hereditary
- A genetic mutation that is known to lead to stomach cancer
- Hereditary non-polyposis colorectal cancer (HNPCC, also known as Lynch syndrome)
- Familial adenomatous polyposis (FAP)

**During the study:**

- You will receive a physical exam, blood and urine tests, imaging studies (MRI and CT scans), and genetic testing
- Your relatives may also be eligible to participate

*All study-related tests and procedures are provided at no cost. Travel costs may be reimbursed.*
