

Positron Emission Tomographic (PET) Imaging of Efflux Transporters

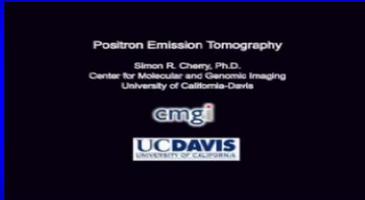

Robert B. Innis, MD, PhD
Molecular Imaging Branch
NIMH

Outline of Talk

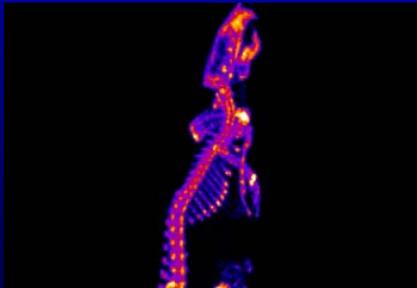

1. PET: high sensitivity and specificity
2. Many PET ligands already exist to measure density of transporters – e.g., dopamine transporter in Parkinson disease
3. P-gp: efflux transporter “protects” organs like brain and testis from some toxins and drugs
4. [¹¹C]loperamide: avid P-gp substrate but has radiometabolite; measures function
5. [¹¹C]desmethyl-loperamide (dLop): metabolite is better than parent
6. After P-gp blockade, [¹¹C]dLop has high brain uptake that is dependent on flow
7. [¹¹C]dLop in humans: no brain uptake at baseline and slightly increased by P-blockade

Positron Emission Tomography

NIH Rodent PET Camera ¹⁸F bone uptake rat

Developed By: Mike Green & Jurgen Seidel

PET vs. MRI

	PET	MRI
Spatial Resolution	2 – 6 mm	<< 1 mm
Sensitivity	10^{-12} M	10^{-4} M
Temporal Resolution	minutes	<1 sec

Radionuclide (¹¹C): high sensitivity
Ligand (raclopride): high selectivity
Radioligand [¹¹C]raclopride: high sensitivity & selectivity

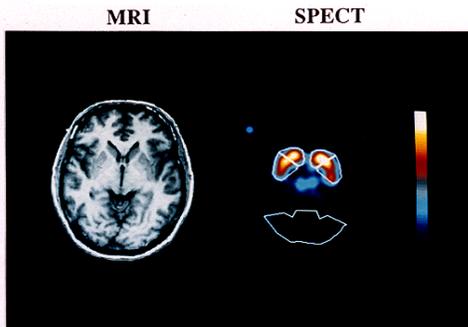

Radioligand = Drug + Radioactivity

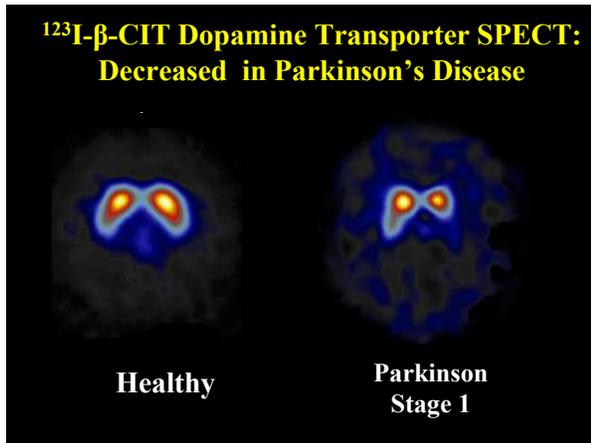

- 1. Drug administered at tracer doses
 - a) No pharm effects
 - b) Labels <1% receptors
 - c) Labeled subset reflects entire population
- 2. Radioligand disposed like all drugs
 - a) Metabolism & distribution
- 3. Radiation exposure

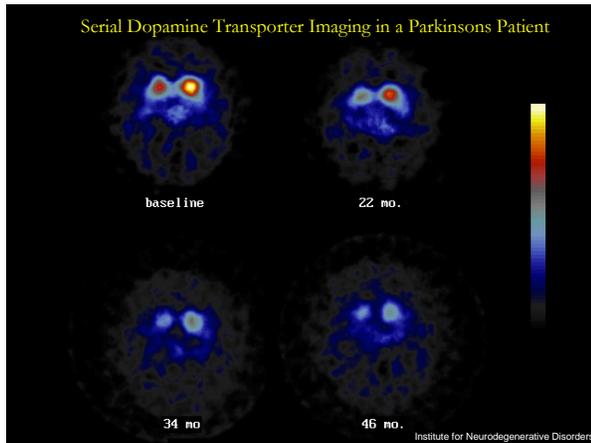

**Dopamine Transporter: Located on DA Terminals
Removes DA from Synapse**

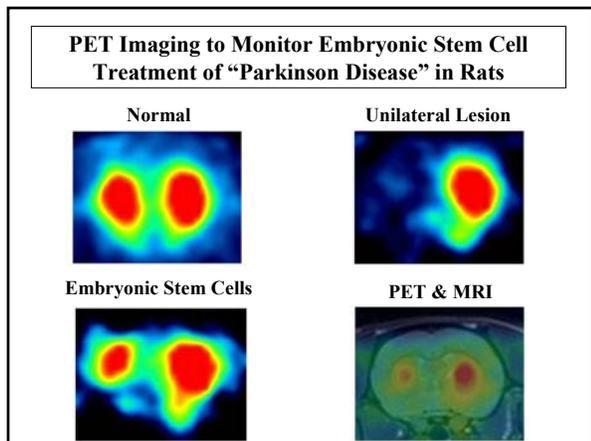

**SPECT Imaging of Dopamine Transporter
in Caudate and Putamen of Human Brain**

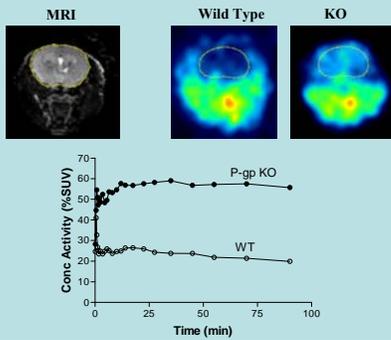

P-glycoprotein (P-gp) Efflux Transporter

1. Transports drugs out of cells in many locations – e.g., brain and testes
2. Specific component of blood-brain barrier
3. Loperamide (Imodium®) is a potent opiate that acts on gut to slow motility – but no actions in brain.
4. Over expressed in 40% of tumors resistant to chemotherapy

¹¹C]Loperamide: brain uptake much higher in P-gp KO than in wild type mice

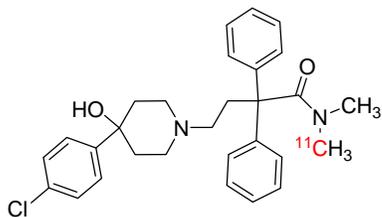

Injection of [¹¹C]Loperamide in P-gp Knockout and Wild Type Mice

Radiochemical Species	Brain		
	Concentration (%SUV)		% Brain Activity
	KO	WT	
[¹¹ C]Loperamide	25	2	50%
[¹¹ C]dLop	12	1	24%
[¹¹ C]Metabolites	14	11	26%
Total	51	14	100%

Five P-gp KO and five WT mice were killed 30 min after injection of [¹¹C]loperamide.

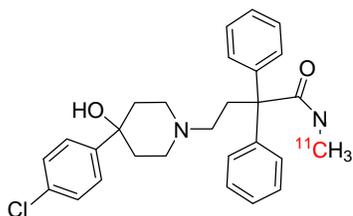

PROBLEM of [¹¹C]Loperamide
Radiometabolite (desmethyl) enters brain

[¹¹C]Loperamide

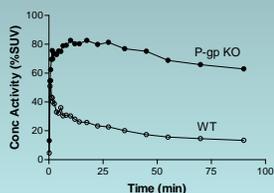

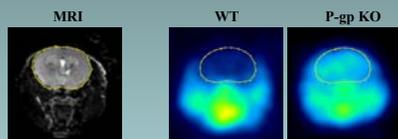

Solution: Remove the nonradioactive methyl group

[¹¹C]Desmethyl-loperamide: Better radioligand?
Demethylation product does not enter brain

[¹¹C]dLop: brain uptake much higher in
P-gp KO than in wild type mice

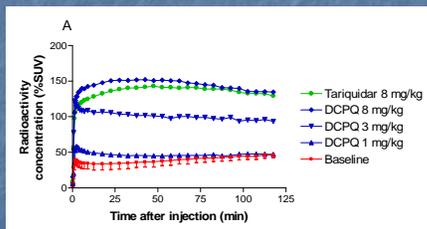

Injection of [¹¹C]N-desmethyl-Loperamide in P-gp Knockout and Wild Type Mice

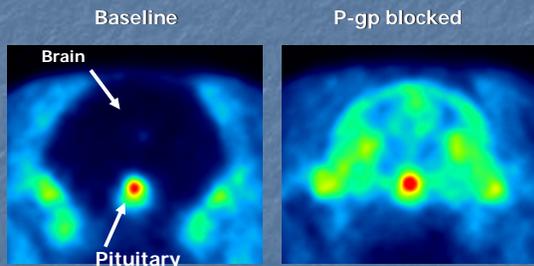

Radiochemical Species	Brain		
	Concentration (%SUV)		% Brain Activity
	KO	WT	KO
[¹¹ C]dLop	36	2	92 %
[¹¹ C]Metabolites	3	3	8 %
Total	39	5	100 %

Three P-gp KO and three WT mice were killed 30 min after i.v. injection of [¹¹C]dLop.

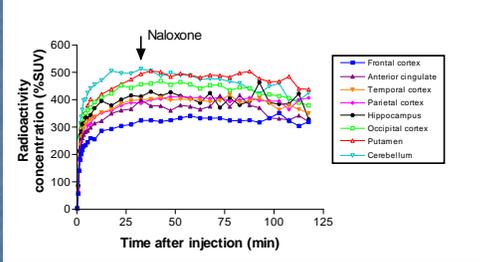

DCPQ or Tariquidar Increases Brain Uptake of Radioactivity in Monkey Given [¹¹C]Loperamide

[¹¹C]dLop in Monkey Brain

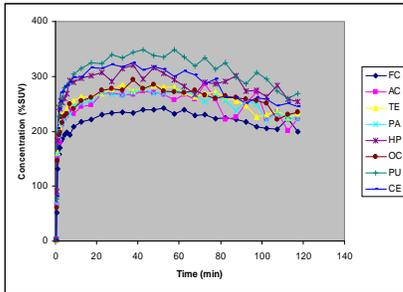

[¹¹C]dLop in Monkey Brain: Radioligand does not bind to opiate receptors

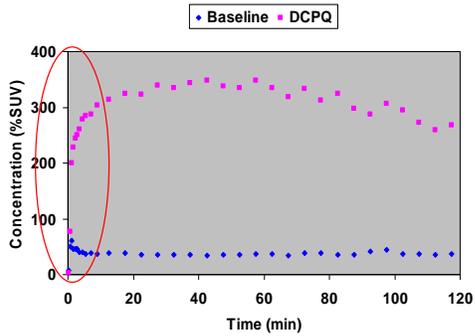

DCPQ 16 mg/kg, Naloxone 5 mg/kg (30 min after injection)

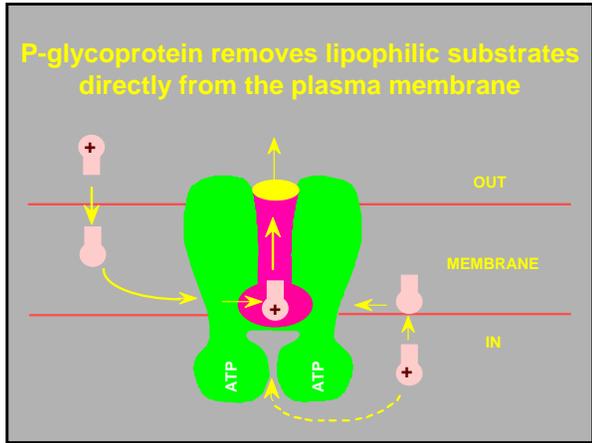

Is P-gp function uniformly distributed in brain?

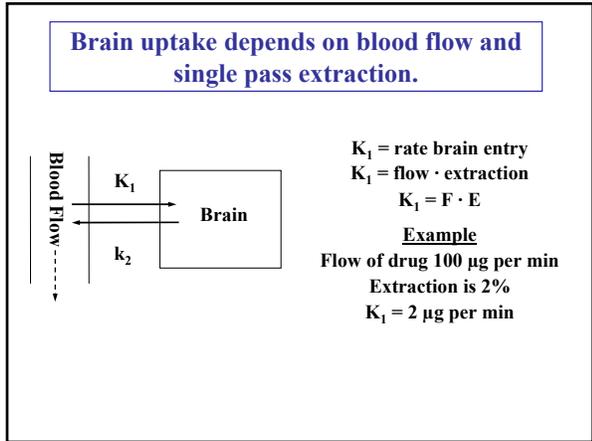

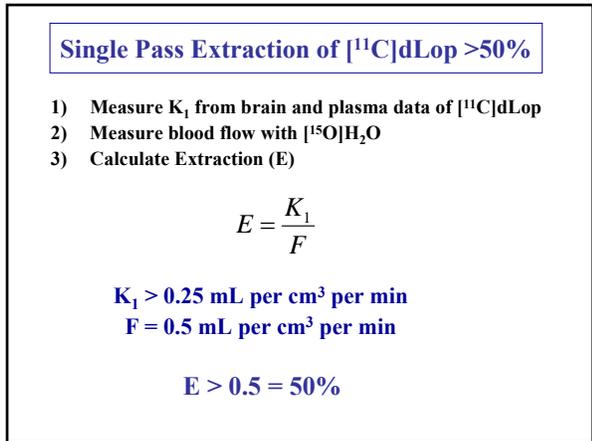

FC=Frontal Cortex, AC=Anterior Cingulate Gyrus, TE=Temporal Cortex, PA=Parietal Cortex, HP=Hippocampus, OC= Occipital Cortex, PU=Putamen, CE=Cerebellum

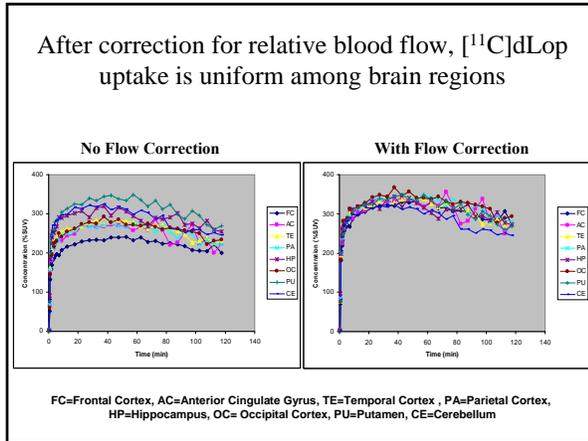

Brain uptake is rapid and probably dependent on blood flow.

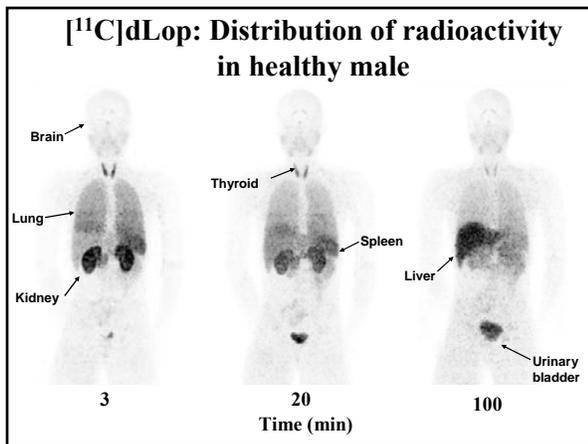

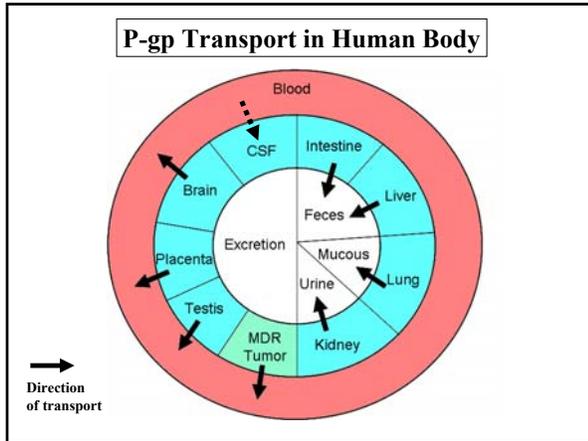

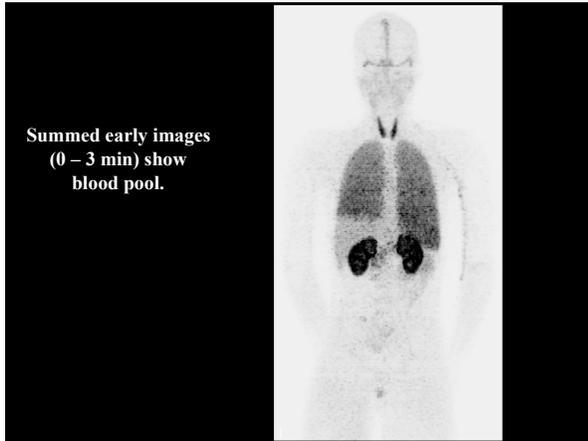

Conclusions

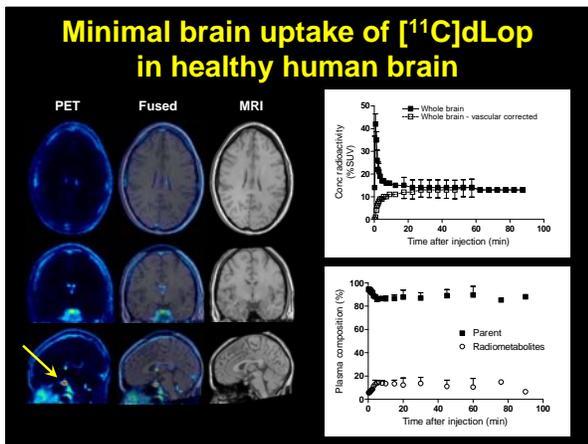

1. [¹¹C]dLop: avoids metabolite problem of [¹¹C]loperamide
2. After P-gp blockade, single pass uptake of [¹¹C]dLop into brain is high and, therefore, shows dependence on blood flow

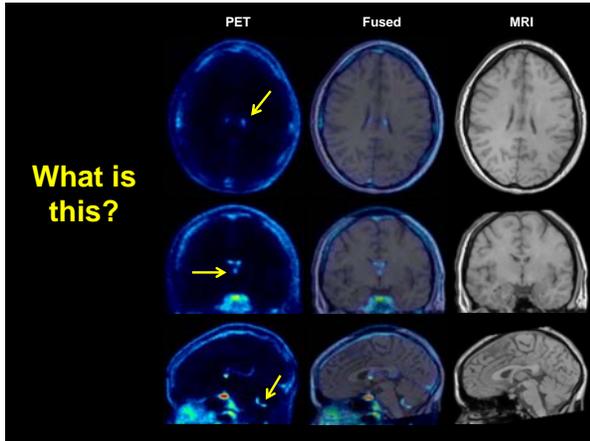

Implies function of P-gp at baseline is rapid and has high capacity

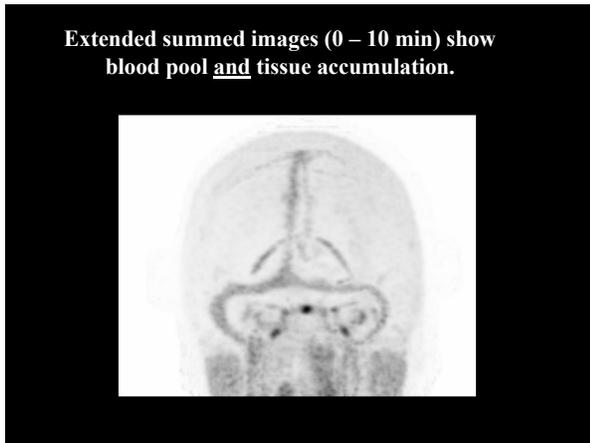

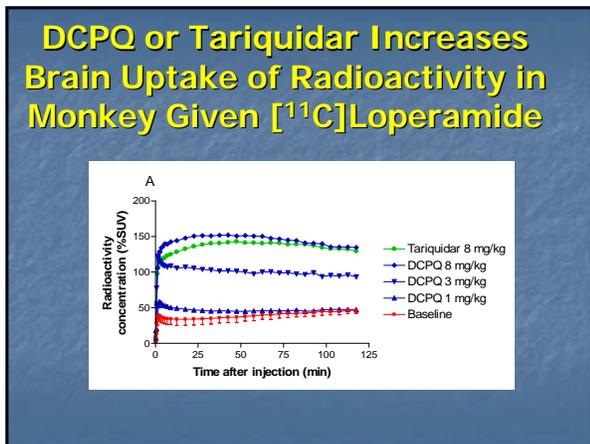

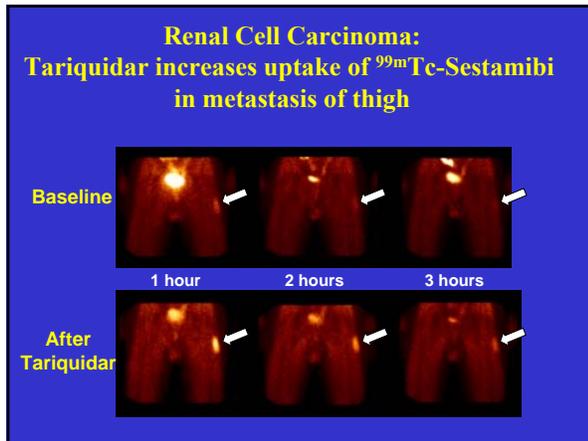

- Future Directions**
1. BRAIN: Potential dysfunction of P-gp at blood-brain barrier: Alzheimer's disease, Parkinson's disease, epilepsy
 2. ONCOLOGY: P-gp function in tumor cells transplanted into mice
 3. Develop radiolabeled inhibitor to measure density, rather than function, of P-gp

- Outline of Talk**
1. PET: high sensitivity and specificity
 2. Many PET ligands already exist to measure density of transporters – e.g., dopamine transporter in Parkinson disease
 3. P-gp: efflux transporter “protects” organs like brain and testis from some toxins and drugs
 4. [^{11}C]loperamide: avid P-gp substrate but has radiometabolite; measures function
 5. [^{11}C]desmethyl-loperamide (dLop): metabolite is better than parent
 6. After P-gp blockade, [^{11}C]dLop has high brain uptake that is dependent on flow
 7. [^{11}C]dLop in humans: no brain uptake at baseline and slightly increased by P-blockade

**Self-Assessment Quiz:
True or False?**

- Loperamide, an antidiarrheal drug, lacks central nervous system opiate effects because P-gp (Permeability-glycoprotein) blocks its entry into brain.
- Positron emission tomography (PET) can measure the function of P-gp *in vivo* by using a radiolabeled P-gp substrate such as [¹¹C]loperamide.
- PET can monitor the *in vivo* metabolism of radioligands. By measuring P-gp function, PET can also monitor drug distribution.
